I have a website that is currently made by hand, but is very ugly. I was wondering if there is a program (or a set of programs) that would best fit my needs? Something that could, for example, take a simple html/css file and generate a more elegant one. Or do I have to go through it by hand, one very ugly step after another (and because of that, some key elements won't work)? A: This is going to be really generic and am not sure how helpful it is, but in general, Bootstrap will let you very quickly generate a design from a standard base design. This can be done by using the CDN link and using their included CSS or you can download their bootstrap CSS here for local use. From there you'd want to install one of several CSS resettors that will let you generate a custom CSS design from a predefined CSS framework/design and bring your CSS into your design. All of these generally require JavaScript to function but should give you the ability to start with a predefined design and modify it to your personal needs. Q: Can I have systemd services listen for local host connections? I'm wondering if I can have a systemd service listen for local connections from another machine? Currently I have a program listening on 127.0.0.1:8080 and want to have another machine connect. A: I've just used ListenStream in a similar example. I used it to resolve DNS records

```
#!/usr/bin/env bash # make listening sudo systemctl start dnsmasq sudo systemctl enable dnsmasq # config file locations config=/etc/rrsets.conf user=rrest=/etc/rrest # lookup local addresses 3ef4e8ef8d
```
