The concept is simple: password hashes are generated and stored, and keyed against the user accounts. Users have to enter the correct password in order to log on, but everything related to the password

is stored and accessible in this neat little utility. You can create a password manager with numerous accounts. A user can create an account, and then you can assign a password to it. You can assign the above-mentioned account to different roles. For example, you can create an administrator account and all the non-administrator accounts, and then the administrator will gain access to all the other

accounts. This can be a good way to protect the administrative accounts, while ensuring that all other users can perform their regular job duties as well as access the admin control panel.... 3.08 MB This list describes all the sectors that are located on a Hard Disk drive and how to access them.
